

Removing vocals

Power Vocal Remover is a tool that allows removing a lead vocal from a stereo recording. It bases on a common technique used in song mastering – lead vocal is usually mixed equally between both stereo channels.

To start AI Vocal Remover click **AI Vocal Remover** button on the toolbar () or select **AI Vocal Remover** from **Toolbox** menu.

AI Vocal Remover

Input:
D:\music\Muppet.mp3
 or drop MP3 file anywhere in this window

Output folder: *(Vocal-removed file will have **-music** added to the original name)*
D:\music
 ☐ Don't change when loading file ☒ Also create vocal-only file

Output format: WAV

Processing mode: ⓘ
☐ Normal
☐ Best
☒ Highest
☒ Keep backing vocals
☒ Show completion message

Files

Here you may select the input and the output of the processing. By default the input file is the current soundtrack and the output name is created by appending **-music** to the input name. You may also create a vocal-only track (it will have **-vocal** added to the name).

Output folder is where the files will be written to.

Output format

You may create MP3 or WAV files. For MP3 format it is possible to adjust encoding parameters.

Processing mode

You may choose one of two processing modes, we recommend using **Best**, but if it does not work or is too slow, try **Normal** or **Highest**.

Keep backing vocals will run additional processing that tries to retain background harmonies, doubles, and other supporting vocal layers while removing the main vocal
