

Adding songs from hard disk with Smart Add

To scan a hard ^{disk} for karaoke files, click the **Smart Add** button in the main window, click the **Smart Add** button on the toolbar (), or select **Smart Add** from the **Folder** menu. The **Smart Add** dialog box will appear.

It allows you to scan the hard drive for karaoke songs and add them to the DVD structure.

Folder to search specifies the initial folder on the hard drive that contains the songs. If you would like to include subfolders, make sure to select the **Include subfolders** option. Also pick the type of files you would like to add. Currently MP3+G (pairs of MP3 and CDG files of the same name) and BIN files are supported. If you need software to create MP3+G or BIN files use Power CD+G Burner.

Karaoke DVD Burner can use ID3 tags from MP3 files or parse the filenames to determine the artist's name and song title. If you have ripped the songs with software that writes ID3 tags to MP3 files (Power CD+G Burner does this), then select the **Read title/artist data from ID3 tags in MP3 files**. If no ID3 tag is available Karaoke DVD Burner may use the filename to extract the names. Choose the correct naming template from the list below.

Automatic folder creation allows you to choose how folders will be created. The following modes are available:

- songs will be added to the current folder

- a new folder will be created and songs will be added there (this is best if you would like to organize your DVD by CD+G disc names)
- a new folder will be created for every artist (this works only for discs for which track list has been downloaded)
- a folder with the first letter of the artist name will be created (this is best for creating alphabetically ordered DVD); this mode also works only when track list is available

Once you click **OK**, Karaoke DVD Burner will scan your hard disk and add the files to the DVD structure.
